

Developer-Visible $\neq$ Agent-Visible

Why a documented, schema-compatible API evolution can still be silent to a deployed agent.

Developer-visible channels

- Changelog
- Migration guide
- Dashboard or email
- Release notes

Developer may be informed

documented

Propagation gap

- Documented does not mean injected
- Schema and description may stay unchanged
- OO response gives no rule signal

not propagated

Agent-runtime channels

- Tool schema in prompt
- Tool description or injected context
- Current API response
- Runtime error, diagnostic, or migration note

Agent can use only this surface

Failure condition

Semantic change + unchanged call surface
+ execution exposure + no runtime visibility
→ compliant semantic failure

Concrete public changelog example

Stripe Address Element state
Before: browser-locale format
After: Latin format by default
Same call/event succeeds; output semantics changed

Developer-visible release communication $\neq$ agent-runtime observability.
